MOBILE APP QA TESTING

Functional, Usability & Compatibility Testing Sample

Role: Manual QA Tester

Project Type: Personal QA Portfolio Project

Application: Mobile Shopping App (Sample)

Platform: Android

Testing Focus: Functional Testing • UI Testing • Negative Testing • Compatibility • Bug Reporting

This document demonstrates practical manual mobile QA skills through a simulated shopping application scenario. It is a personal portfolio sample and is not client work.

1. Testing Overview

Objective

Validate essential mobile shopping workflows, input validation, UI behavior, navigation, and device compatibility while identifying defects that could affect user experience.

Scope

In Scope	Out of Scope
Login / Logout	Penetration testing
Product browsing and search	Backend performance testing
Product details and cart	Load/stress testing
Checkout validation	Payment gateway certification
Device rotation and UI layout	Production monitoring
Network interruption behavior	Automated testing

Test Environment

Device	Android smartphone (sample test environment)
OS	Android 14
App Type	Native mobile shopping application
Network	Wi-Fi / Mobile Data
Testing Type	Manual / Black-box
Approach	Functional, exploratory, negative, UI and compatibility testing

2. Mobile Test Case Execution

ID	Test Scenario	Expected Result	Status
MTC-001	Login with valid credentials	User is logged in and redirected to the home screen.	PASS
MTC-002	Login with invalid password	Error message appears and login is rejected.	PASS
MTC-003	Search for an existing product	Relevant search results are displayed.	PASS
MTC-004	Open product details	Correct image, name, price and details are displayed.	PASS
MTC-005	Add product to cart	Selected product appears in the cart.	PASS
MTC-006	Increase item quantity	Quantity and total price update correctly.	PASS
MTC-007	Remove item from cart	Item is removed and total is recalculated.	PASS
MTC-008	Checkout with missing required field	Submission is blocked and validation is displayed.	FAIL
MTC-009	Rotate device on product page	Layout remains usable without overlapping elements.	FAIL
MTC-010	Disable network during product loading	App handles connection loss gracefully.	PASS
MTC-011	Enter invalid email during checkout	Invalid email format is rejected.	PASS
MTC-012	Logout	User session ends and protected screens require login.	PASS

Result: 10 Passed • 2 Failed • 12 Executed

3.1 MBUG-001 — Checkout button remains active when a required address field is empty

Severity: High **Priority:** High

Steps to Reproduce

1. Log in with a valid account.
2. Add any product to the cart.
3. Open checkout.
4. Leave the required shipping address blank.
5. Tap Place Order.

Actual Result: The app allows the checkout flow to continue or the button remains active without clearly informing the user that the address is required.

Expected Result: The app should block submission and display a clear required-field validation message.

Environment: Android 14 / Mobile data

3.2 MBUG-002 — Product layout overlaps after device rotation

Severity: Medium **Priority:** Medium

Steps to Reproduce

1. Open the product details screen.
2. Rotate the device from portrait to landscape.
3. Observe the product image, price and action controls.

Actual Result: One or more UI elements overlap or become partially inaccessible after rotation.

Expected Result: The layout should adapt to the new orientation without overlapping or hiding important controls.

Environment: Android 14 / Wi-Fi

3.3 MBUG-003 — Cart total does not refresh immediately after quantity change

Severity: Medium **Priority:** Low

Steps to Reproduce

1. Add a product to the cart.
2. Increase the quantity.
3. Observe the displayed total without leaving the screen.

Actual Result: The total remains unchanged until the cart screen is refreshed or revisited.

Expected Result: The total should recalculate immediately after quantity changes.

Environment: Android 14 / Wi-Fi

4. Mobile Compatibility Checks

Check	Expected Behavior	Result
Portrait orientation	All controls remain visible and usable.	PASS
Landscape orientation	Layout adapts without overlapping content.	FAIL
Wi-Fi connection	Core workflows work normally.	PASS
Mobile data	Core workflows work normally.	PASS
Network interruption	User receives useful feedback and app remains stable.	PASS
Back navigation	Back action returns user to the expected previous screen.	PASS
Keyboard behavior	Input fields remain visible when the keyboard opens.	PASS

Testing Note

Mobile testing should consider differences in screen size, orientation, operating system behavior, network conditions, touch interaction, keyboard behavior, and device resources. These checks complement functional test execution.

5. QA Test Summary

Metric	Result
Total test cases executed	12
Passed	10
Failed	2
Pass rate	83.3%
High-severity defects	1
Medium-severity defects	2
Critical defects	0

Release Assessment

The core mobile shopping flow is generally functional, but checkout validation and orientation-related UI behavior should be addressed before release. High-priority checkout validation should be fixed and retested, followed by regression testing across affected workflows and supported device configurations.

QA Skills Demonstrated

Mobile functional testing • UI testing • Compatibility testing • Positive/negative testing • Exploratory testing • Defect identification • Severity/Priority assessment • Reproduction steps • Test execution reporting

Portfolio Note

This is a self-created QA portfolio sample designed to demonstrate manual mobile testing and defect-reporting skills. It is not client work and does not represent testing performed for a real company.
